CAUTION FOR USE

Procedure for attaching inserts

1) Use an air blower or brush to clean the insert seats before attaching the inserts.
2) Holding the inserts firmly against the insert seat, tighten the clamp screws using the wrench provided.
3) Tighten the clamp screws in the order shown in Figure 1.
4) Apply anti-seize lubricant to the clamp screws and tighten them with the torque specified.
   The specified torque is as follows.
   AXD7000 3.5N•m(2.58ft•lb)
   AXD4000 1.5N•m(1.11ft•lb)
5) Clamp screws are important parts from the viewpoint of safety. Use clamp screws with the correct part number.
   If the spindle speed is equal to or higher than the values shown in Table 2, it is recommended to replace the clamp screws with new ones when changing inserts.

6) Check that there are no gaps between the insert and the seat before use.

Procedure for attaching the cutter to an arbor

1) Before attaching the cutter to the arbor, carefully clean the socket and end of the cutter and the end of the arbor.
2) Place the cutter on the arbor and tighten the attachment bolt provided. See the table below for the tightening torque.
3) The attachment bolt provided with the AXD is a special bolt for through coolant. Take care not to lose it.

Even when operating under the maximum allowable spindle speed, if the spindle speed is equal to or higher than the values shown in table 2, it is recommended that the balance quality (with the arbor or milling chuck) conforms to G6.3 or betterbased on ISO1940.
It is also recommended to replace the clamp screws with new ones when changing inserts.
Furthermore,ensure to use machines that are provided with safety measures in case of cutter breakage.
(Note) The balance quality of the holder (without inserts and clamp screws) is G6.3 or better at 10,000min^{-1}.

When setting the spindle speed, take into consideration the maximum allowable spindle speed of the arbor or milling chuck.
Use the specified set bolt when using the arbor type with through coolant.
The inserts have sharp cutting edges and handling them with bare hands may cause injuries.
Always wear safety gloves when handling the indexable inserts.

						15—20	<0.10	<0.15	<0.20

(Note 1) The above cutting conditions are determined based on high workpiece and machine rigidity, where no vibration occurred. If vibrations occur make adjustments according to the machining conditions.
(Note 2) Note, vibrations may occur in the following conditions.
- When using long tool overhang.
- When pocket machining corner radii.
- When the workpiece has poor clamping rigidity or when the machine rigidity or workpiece rigidity is low, vibrations can occur easily, if so, reduce cutting conditions such as width and depth of cut and feed per tooth.

(Note) The recommended ramping feed is 0.05mm/tooth or under.
✱1 Using the maximum ramping angle, the distance to reach the maximum depth of cut is as follows:
L= (maximum depth of cut ap/tan α). Maximum depth of cut A type is 21mm, B type is 20.4mm.
✱2 The maximum diameter when machining a blind hole with a flat face using a corner radius of 0.8mm for A type and 4mm for B type. For other corner radii, use the formula below.
{(cutting edge diameter D1)—(corner radius Re)—0.3}×2
✱3 The minimum diameter when machining a blind hole with a flat face using a corner radius of 0.8mm for A type and 4mm for B type. For other corner radii, use the formula below.
{(cutting edge diameter D1)—(corner radius Re)—(width of wiper edge F1)—0.1}×2

AXD7000 can be effectively used for pocket machining without the need for a prepared hole.
